To the "Age of Preparedness"?

How do societies come to terms with the fact that there are complex threats out there from which they cannot be protected and which will surely strike them? What role can the EU play in preparedness efforts? What does this mean for the construction of an European identity?

We want to discuss the historical roots, the possible practical present and future responses to threats and anticipated crises (especially but not only) in the realm of health. What are the consequences of a transition from the "Age of Prevention" to the "Age of Preparedness" or even the "Age of Resilience"?
